code of autonomous Period.

The program of Intake & Launch part is similar to the last season : spin-up. So we just give out the code of hanging.

```
void rcHang ()
{
    if ( controller 1. Botton X. pressing ())
    {
                    => lock
        hang. set ( ! hang. value());
        wait Until ( ! controller 1 BottonX. pressing ())
    }
}        It's easy to understand  Ah
```

So the difficult part comes to the Autonomous Period. First we design the route.

-※ in fact. the robot will not across that Line
