# Driver's Diary - 2

Due to the limited number of buttons on the controller, we had to assign the control of the wings to the right button.

However, as I'm a left-handed single-stick operator, this button placement required me to stop the Robot in order to open the wing. It felt awkward to control the wings using the original controller while maneuvering through the field.

Therefore, my captain used a 3D printer to create 2 auxiliary devices for me! :D
