Driver's Diary - 3

During tonight's training session, the main focus was on practicing the navigation through the channel and loading individual Triballs in coordination with another team member. During the practice, I discovered a trick: when navigating several Triballs into the Robot, the rear of the Robot can be positioned against the bar, while the front can be slightly angled outward.

On the other hand, when loading a single Triball, the Robot can be angled at 45 degrees or even greater. This allows my teammate can place the Triball into the roller easily, without worrying about rolling away.
