Storm

Structure

1. Ratchet

During the competition, there were many problems with ratchet. Mostly due to the deformation of the ratchet lock and bearing frame caused by uneven force, so that the ratchet cannot work. Therefore, we will modify the 2 sets of ratchets to obtain higher strength.

2. Intake

Our other team adopted the intake of double sets of rubber wheels (we tested that before), which played an important role in elimination competition. On the defensive side, when the opposing machine held the ball, we used these roller grab many Triball and prevented the opposing Robot from Single-Triball attacks
