

Lifting elevation arm also served as a deception tactic against opponents, making them believe that we were going to horizontal bar, thus occupying their defense focus. This would give our teammate enough time to perform a high elevation, avoiding being controlled by the opponent, preventing failure.

16/1

CATA USING EXPERIENCE

After completing the construction of the new cata mechanism as a Load-operator. I immediately took several Triball and tried to throw.

Unexpectedly, instead of flying to the other side, the Triballs repeatedly hit the long barrier pole. Kevin told me how to do it. When placing the Triball, it is necessary to wedge the 2 corner of it, inside the Triball storage, with the Triball's surface pressed against the PC board in front of the storage.

Then I tried to coordinate with another teammate. Through repeated training, we were able to synchronize our action with only one beat of pause between. But it is still not fast enough and will influence the Skill Challenge.
